

EX.No 1: Create an Exposure of Web Application and Tools

Aim:

To develop an Asp.Net application to Create an exposure of Web applications and tools

Procedure:

Steps:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a Template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→Select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one MultiView control, and 4 View controls within the Multiview control onto the form.
8. On the view1 control, place textbox control, one calendar control,one radiobuttonlist and one button control.
9. On the view2 control, place one checkboxlist control and two button controls.
10. On the view3 control, place one dropdownlist control and two button controls.
11. Open the aspx.cs file and write the event-handling code for the controls
12. Run the application by pressing F5 or clicking the Start button in Visual Studio.
13. Stop the application by clicking the Stop button in Visual Studio.

EX.No 2: Web Application using Html Controls

Aim:

To develop an Asp.Net application to Implement the Html Controls

Procedure:

Steps:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.

7. Place one TextBox, Password, two Radio buttons, one Select control, four CheckBoxes, one Submit and one Reset controls from the Toolbox under HTML controls onto the form.
8. Open the aspx.cs file and write the event-handling code for the controls
9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

Ex.No:3 WEB APPLICATION USING SERVER CONTROLS

Aim:

To develop an Asp.Net application to Implement the Server Controls

Procedure:

Steps:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a template window → choose Empty → click OK button
5. In Solution Explorer, right-click on the web application → select Add → choose Web Form → click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one TextBox, TextArea, two Radio buttons, one Select control, five CheckBoxes, one Submit from the Toolbox under HTML controls onto the form and set the attribute runat="server" for all the controls.
8. Open the aspx.cs file and write the event-handling code for the controls.
9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

Ex.No:4 Web Application using web controls

Aim:

To develop an Asp.Net application using Web controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a template window → choose Empty → click OK button

5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place two TextBoxes, one RadioButtonList, one DropDown control,one CheckBox, one Button control and one literal controls from the Toolbox under Standard controls onto the form .
8. Open the.aspx.cs file and write the event-handling code for the controls.
9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

EX.NO 5: WEB APPLICATION USING LISTCONTROLS

Aim:

To develop an Asp.Net application using List controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one DropDownList, one RadioButtonList, one CheckBoxList, one ListBox and one BulletedList controls from the Toolbox under Standard controls onto the form .
8. Open the.aspx.cs file and write the event-handling code for the controls.
9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

EX.NO 6: WEB APPLICATION USING VALIDATION CONTROLS

Aim:

To develop an ASP.NET application to design a web page using rich controls, validate user input using validation controls, and work with file handling concepts.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button

5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→Give it a name→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place five TextBoxes, three RequiredFieldValidator , one CompareValidator, one RangeValidator, one Calender, one FileUpload and one RegularExpressionValidator controls from the Toolbox onto the form .
8. Set the below properties for the controls as per the application's needs.

Control Name	Property Name	Value
RequiredFieldValidator1	ErrorMessage	username is must
RequiredFieldValidator1	ControlToValidate	TextBox1
RequiredFieldValidator2	ErrorMessage	password is must
RequiredFieldValidator2	ControlToValidate	TextBox2
CompareValidator1	ErrorMessage	Password must be same
CompareValidator1	ControlToValidate	TextBox3
CompareValidator1	ControlToCompare	TextBox2
RangeValidator1	ErrorMessage	Enter the age from 18 to 50
RangeValidator1	ControlToValidate	TextBox5
RangeValidator1	MaximumValue	50
RangeValidator1	MinimumValue	18
RegularExpressionValidator	ErrorMessage	Enter proper email id
RegularExpressionValidator	ControlToValidate	TextBox4
RegularExpressionValidator	ValidationExpression	Internet e-mail address
RequiredFieldValidator1	ErrorMessage	select any one file
RequiredFieldValidator1	ControlToValidate	FileUpload1

9. Open the aspx.cs file and write the event-handling code for the controls.
10. Run the application by pressing F5 or clicking the Start button in Visual Studio.
11. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :7 WEB APPLICATION USING DATA CONTROLS

Aim:

To develop an Asp.Net application using Data Controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button

5. In Solution Explorer, right-click on the web application → select Add → choose Web Form → click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place Four TextBoxes, one GridView and one Button control from the Toolbox onto the form .
8. Open the.aspx.cs file and write the event-handling code for the controls.
9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :8 DATA BINDING WITH WEB CONTROLS

Aim:

To develop an ASP.NET application for data binding using web controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a template window → choose Empty → click OK button
5. In Solution Explorer, right-click on the web application → select Add → choose Web Form → click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place three TextBoxes and one dropdownlist control from the Toolbox onto the form
8. Click on View menu-> select SQL Server Object Explorer, a dialog box will be displayed.
9. Click on the arrow on SQL Server → localdb->right click on database->select new database and type the database name as “employee”.
10. Click on arrow on “employee” database ->Right click on Table->select New Table option
11. Create a table with fields Empid,Empname,Designation and Salary and their datatype as nvarchar(50)
12. Change the table name as “employ”
13. Click on Update tab and click update database option.
14. Right click on “employ” table → select view data option.
15. Add five records into the table
16. Open the.aspx.cs file and write the event-handling code for the controls.
17. Run the application by pressing F5 or clicking the Start button in Visual Studio.
18. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :9 DATA BINDING WITH DATA CONTROLS

Aim:

To develop an ASP.NET application for data binding using data controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one grid control from the Toolbox onto the form.
8. Click on View menu-> select SQL Server Object Explorer, a dialog box will be displayed.
9. Click on the arrow on localdb->right click on database->select new database and type the database name as "employee".
10. Click on the arrow on "employee" database ->Right click on Table->select New Table option
11. Create a table with fields rollno,sname,place and phoneno and their datatype as nvarchar(50)
12. Change the table name as "students"
13. Click on Update tab and click update database option.
14. Right click on "students" table → select view data option.
15. Add five records into the table
16. Open the aspx.cs file and write the event-handling code for the controls.
17. Run the application by pressing F5 or clicking the Start button in Visual Studio.
18. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :10 DATABASE APPLICATION TO INSERT,UPDATE AND DELETE OPERATIONS

Aim:

To develop an ASP.NET database application to perform insert, update, and delete operations.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place four textboxes,three buttons and one grid control from the Toolbox onto the form.

8. Click on View menu-> select SQL Server Object Explorer, a dialog box will be displayed.
9. Click on the arrow on localdb->right click on database->select new database and type the database name as "employee".
10. Click on the arrow on "employee" database ->Right click on Table->select New Table option
11. Create a table with fields empid,empname,designation and salary and their datatype as nvarchar(50)
12. Change the table name as "emp"
13. Click on Update tab and click update database option.
14. Right click on "emp" table → select view data option.
15. Add five records into the table
16. Open the.aspx.cs file and write the event-handling code for the button controls.
17. Run the application by pressing F5 or clicking the Start button in Visual Studio.
18. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :11 DATABASE APPLICATION USING DATA CONTROLS TO PERFORM INSERT,DELETE,EDIT ,PAGING AND SORTING OPERATIONS

Aim:

To develop an ASP.NET database application using data controls to perform insert, delete, edit, paging, and sorting operations.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place three textboxes,one button and one grid control from the Toolbox onto the form.
8. Click on View menu-> select SQL Server Object Explorer, a dialog box will be displayed.
9. Click on the arrow on localdb->right click on database->select new database and type the database name as "student".
10. Click on the arrow on "student" database ->Right click on Table->select New Table option
11. Create a table with fields rollno,sname and totalmark and their datatype as nvarchar(50)
12. Change the table name as "stud"
13. Click on Update tab and click update database option.
14. Right click on "stud" table → select view data option.
15. Add five records into the table
16. Open the.aspx.cs file and write the event-handling code for the button controls.

17. Run the application by pressing F5 or clicking the Start button in Visual Studio.
18. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :12 WEB APPLICATION TO IMPLEMENT XML CLASSES

Aim:

To develop an Asp.Net application to Implement the XML classes.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a template window → choose Empty → click OK button
5. In Solution Explorer, right-click on the web application → select Add → choose Web Form → click Ok button
6. In Solution Explorer, right-click on the web application → select Add → choose New Items → select XML file → click Ok button
7. Open the .aspx file and switch to Design View to design the form.
8. Place one button control and one grid control from the Toolbox onto the form.
9. Write xml codings on the xml file and save it as "xmlfile1.xml"
10. Open the aspx.cs file and write the event-handling code for the button controls.
11. Run the application by pressing F5 or clicking the Start button in Visual Studio.
12. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :13 WEB APPLICATION TO IMPLEMENT AUTHENTICATION-AUTHORIZATION

Aim:

To develop an Asp.Net application to Implement Authentication – Authorization.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a template window → choose Empty → click OK button
5. In Solution Explorer, right-click on the web application → select Add → choose Web Form → click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one button control and two textboxes from the Toolbox onto the form.
8. Open the aspx.cs file and write the event-handling code for the button controls.

9. Run the application by pressing F5 or clicking the Start button in Visual Studio.
10. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :14 TICKET RESERVATION USING ASP.NET CONTROLS

Aim:

To develop an ASP.NET application for ticket reservation using ASP.NET controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name →Choose location → click OK
4. In the Select a template window →choose Empty →click OK button
5. In Solution Explorer, right-click on the web application→select Add→choose Web Form→click Ok button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one Menu control with menu items home,reservation and help
8. Place one button control on the web form
9. Set the following properties to the controls.

Control Name	Property Name	Value
Menu1	Orientation	Horizontal
Menu1	StaticHoverStyle-Background	red
Menu1	StaticMenuItemStyle- HorizontalPadding	90px
Reservation	NavigateUrl	WebForm2
Help	NavigateUrl	WebForm3
Button1	Text	Back

10. Again, Add two web forms such as web from2 and web form3
11. Design the web form2 with one textbox, one calender control,two buttons and two drop down list controls
12. Open the aspx.cs file and write the event-handling code for the button controls.
13. Run the application by pressing F5 or clicking the Start button in Visual Studio.
14. Stop the application by clicking the Stop button in Visual Studio.

EX.NO :15 ONLINE EXAMINATION USING ASP.NET CONTROLS

Aim:

To develop an ASP.NET application for online examination using ASP.NET controls.

Procedure:

1. Open Visual Studio->File->New->Project
2. In the New Project window, from the left panel, select Visual C#-->choose ASP.NET Web Application.
3. Give a project name → Choose location → click OK
4. In the Select a Template window → choose Empty → click OK button
5. In Solution Explorer, right-click on the web application → Select Add → choose Web Form → click OK button
6. Open the .aspx file and switch to Design View to design the form.
7. Place one wizard control onto the form. By default, it has only 2 steps and we add extra four steps.
8. On each step, place one radiobuttonlist control.
9. Open the aspx.cs file and write the event-handling code for the controls
10. Run the application by pressing F5 or clicking the Start button in Visual Studio.
11. Stop the application by clicking the Stop button in Visual Studio.
